Methodology

Asset Class Comparisons and Correlations

The asset classes are defined as follows. For real estate, the FTSE EPRA/NAREIT indices are used. For broad equities, the national headline index is used (i.e. FTSE 100, CAC 40 etc.) and for multi-country profiles, the FTSE All-world index series is used. For bonds, the JPMorgan Bond index series is used.

Dividend Yields

The dividend market capitalisation (defined as the dividend multiplied by the shares in issue and free float percentage) paid during the last twelve months as a percentage of the investable market capitalisation of the index.

Local Currency Indices

The local currency indices are claculated using the following approach:

$$\text{Index Value}_t = \frac{\text{Index Value}_{t-1}}{\sum_{\text{For Region or Global}} \left(\frac{\text{Market Cap Country Index}}{\text{Market Cap Regional/Global Index}} \right) \Big/ \left(\frac{\text{Local Currency Country Index}_t}{\text{Local Currency Country Index}_{t-1}} \right)}$$

Please note that the Local Currency Real Estate indices are unofficial series calculated in-house by EPRA for research purposes only. A disclaimer applies to these values, please refer to page 320.

Risk/Return Profiles

The risk/return profile-value is determined by the 10Y average risk (calculated by the standard deviation) on the X-axis and the 10Y average return on the Y-axis.

Size of the total real estate market

We estimate the size of individual country commercial real estate markets using a Gross Domestic Product (GDP) top down approach, and aggregate their values to arrive at a total global estimate. Of course, individual countries are in varying stages of development, therefore, we must adjust country estimates to account for the economic situation. With regard to the sample, we selected 49 countries from four separate regions: Asia-Pacific, Europe, Latin America and North America. In developed countries high quality commercial real estate represents approximately 45 percent of GDP. In developing countries, this figure is lower. We based our estimates on a formula devised by Prudential Real Estate Investors, as published in "A Bird's Eye View of Global Real Estate Markets: Update Fabruary 2012" – Prudential Real Estate Investors, Mandipa Kapas & Dr. Youguo Liang. February 2012. The formula is as follows:

For developed countries: $RE_i = GDP_i \times 0.45$

For emerging countries: $RE_i = GDP_i \times 0.45\left(\frac{GDH_i}{26{,}115}\right)^{\frac{1}{3}}$

Where:

RE_i = Country high-quality commercial real estate value

GDP_i = Country Gross Domestic Product

GDH_i = Country Gross Domestic Product per capita

Methodology

Velocity
This liquidity measure is calculated by the number of shares traded over a 12-month period divided by the free-float adjusted shares in issue at the end of the period.

Volatility
The volatility shows the variability of returns over a 10-year period, revealing the extent by which the returns of an index value change from the average. Low volatility indicates the returns for an index have stayed quite close to the average whereas a high volatility would indicate a larger fluctuation over the time period. Volatility can therefore be seen as a market measure for risk.
